

SCREW WASHERS RUNNING EFFICIENTLY – also known as Sand Screws and Fine Material Washers

If the sand you are producing with a Screw Washer or Sand Screw doesn't look something like the material in these photos, then you are probably NOT running your equipment efficiently.

A Screw Washer that has been correctly set up, to match the feed and make the required product, is probably the most efficient sand washing equipment available, today.

These photos were taken at Australian operations, on routine site visits, by the principal of Rivergum Industries. They were taken without any prior warning. They are not doctored, other than some extra areas were "cropped" out, nor were they "set up". The operators were merely well trained, they understood their equipment and used it, as designed.

In excess of 80% solids can be achieved from a properly run Screw Washer.

Rivergum Industries, delivering efficiency into the aggregates industry.
